

ABSTRACT OF THE DISCLOSURE

2 A system and method are provided for enabling faster downloading and printing of data
3 received from an external content source. In one embodiment, the method is segmenting the data
4 file available on a content source external to the user computing device into a plurality of
5 portions; independently downloading to said computing device each of said plurality of portions;
6 and assembling each downloaded portion into a second data file on said computing device, to
7 match such first data file. In a second embodiment the method is (a) selecting a first data file to
8 be printed from said plurality of data files; (b) downloading said selected data file form a content
9 source external to a computing device connected to the printer, (c) once said selected data file is
10 entirely downloaded into said computing device, processing said selected data file and sending
11 the processed data to the printer for printing; and (d) during said steps of processing and sending,
12 selecting the following data file from said plurality of data files and repeating steps (b) (c) and
13 (d) for said selected data file.
